## 1 Syntax

---

$t$	$::=$	<b>terms:</b>
	$x$	variable
	$unit$	constant unit
	$true$	constant true
	$false$	constant false
	$\lambda x : T.t$	function abstraction
	$t\ t$	function application
	$(t, t)$	pair
	$t.1$	first projection
	$t.2$	second projection
	$if\ t\ then\ t\ else\ t$	conditional
	$run\ C$	static lifting
	$\zeta\ p : W.C$	circuit abstraction
$v$	$::=$	<b>values:</b>
	$\lambda x : T.t$	abstraction value
	$(v, v)$	pair value
	$unit$	unit value
	$true$	true value
	$false$	false value
	$\zeta\ p : W.C$	circuit value
$T$	$::=$	<b>types:</b>
	$Unit$	unit type

	$Bool$	boolean type
	$T \times T$	product type
	$T \rightarrow T$	function type
	$T \rightsquigarrow T$	circuit type
$\Gamma$	$::=$	<b>contexts:</b>
	$\emptyset$	empty context
	$\Gamma, x : T$	term variable binding
$W$	$::=$	<b>wire types:</b>
	$One$	wire unit type
	$Bit$	bit type
	$Qubit$	qubit type
	$W \otimes W$	wire product type
$p$	$::=$	<b>wire patterns:</b>
	$()$	empty
	$w$	wire variable
	$(p, p)$	wire pair
$C$	$::=$	<b>circuits:</b>
	$output\ p$	output a pattern
	$p_2 \leftarrow gate\ g\ p_1; C$	gate application
	$p \leftarrow C; C$	circuit composition
	$x \leftarrow lift\ p; C$	dynamic lifting
	$unbox\ t\ p$	circuit application
$\Omega$	$::=$	<b>wire contexts:</b>
	$\emptyset$	empty context
	$\Omega, w : W$	wire variable binding

---

## 2 Type Checking Rules

First, we need to define what is a well-formed wire context.

**Definition 1** (Well-formed Wire Contexts). *A wire context  $\Omega$  is well-formed, if there are no duplicate wire variables in it. For simplicity, we always assume the wire contexts are well-formed in the following contexts. And when we write  $\Omega_1, \Omega_2$ , we require  $\Omega_1$  and  $\Omega_2$  to be disjoint to preserve the well-formedness.*

Since there are three different kinds of terms:  $(\lambda)$ -terms, wire patterns and circuits, we have three different relations for each of them to check the correctness.

- $\Omega \Rightarrow p : W$  is used to check the well-formedness of patterns.
- $\Gamma; \Omega \vdash C : W$  is the typing relation for circuits;
- $\Gamma \vdash t : T$  is the typing relation for  $(\lambda)$ -terms;

**Well-formed patterns:**  $\boxed{\Omega \Rightarrow p : W}$

$$\overline{\emptyset \Rightarrow () : One}$$

$$\overline{w : W \Rightarrow w : Wz}$$

$$\frac{\Omega_1 \Rightarrow p_1 : W_1 \quad \Omega_2 \Rightarrow p_2 : W_2}{\Omega_1, \Omega_2 \Rightarrow (p_1, p_2) : W_1 \otimes W_2}$$

Typing rules for circuits:  $\boxed{\Gamma; \Omega \vdash C : W}$

TODO: add typing rules for circuits.

Typing rules for ( $\lambda$ -)terms:  $\boxed{\Gamma \vdash t : T}$

TODO: add typing rules for terms.

### 3 Operational Semantics

TODO: add semantics.
